# Systems Development Life Cycle (SDLC)

Click on a phase of the SDLC to learn more about it

# Plan Phase

- Also referred to as the Requirements Analysis phase
- Most important phase in the SDLC
- Elements of the Plan Phase
  - Determine what concern this application will address
  - Gather and analyze requirements
  - Risk assessment conducted
  - Project Schedule developed
  - Initiation meeting with stakeholders
- Deliverables: Project schedule, Requirements document, Scope of Work (SOW)

The most important task during this phase is gathering and analyzing requirements.

# Design Phase

- The Design Phase is where the application's design is determined and documented
- Change Management should be implemented in this phase
- Elements of the Design Phase
  - Application's architecture is determined
  - Design document is developed
  - Integration with existing systems is determined
  - Processes and procedures are determined
  - Initial diagrams of the system are developed
- Deliverables: Design document, processes, diagrams

Customer requirements gathered in the Plan phase are vital to the Design phase.

## Develop Phase

- The Develop phase is where the application is built
- Change Management begins during this phase
- Elements of the Develop Phase
  - A beta version of the application is developed
  - Processes and procedures for use with the application are written
  - Training materials are developed
  - Test scripts are developed
  - Test resources are determined
- Deliverables: Beta version of the application, training materials, test scripts

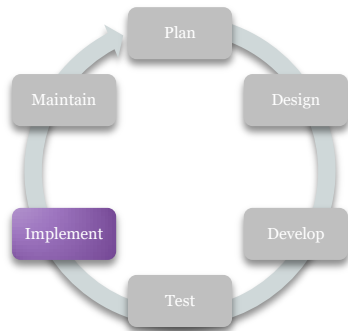

The Develop Phase is typically the longest phase of the SDLC.

# Test Phase

- The Test phase is where User Acceptance Testing (UAT) takes place
- This phase could be repeated depending on test results
- Elements of the Test Phase
  - UAT testing takes place
  - Testing includes server load tests
  - Test results are documented
  - Changes are implemented, documented and tested
- Deliverables: Test results, documented changes made to the application

Change Management processes are important during this phase.

## Implement Phase

- The Implement Phase is where the application is deployed to end users
- End user training is an important part of this phase
- Elements of the Implement Phase
  - Training approximately one week prior to deployment
  - User feedback collected and documented
  - Close out meeting takes place
  - Customer sign off
- Deliverables: Application deployed, training, customer sign-off, lessons learned documented

Communication with the end user community is vital during this phase.

## Maintain Phase

- The Maintain Phase takes place after successful deployment of the application and customer sign off
- The application will either be handed off to the customer or managed by the onsite Program Management Office (PMO)
- Customer follow-up is essential during this phase
- An annual assessment should take place to determine if any changes need to be made
- Deliverables: A satisfied customer that would be happy to do business with you in the future

Maintaining communication with the customer is vital after the project ends.
